

EL CAPULÍN

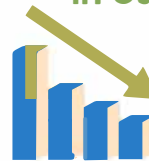

REVEILLE UMC

Honduras had a dengue epidemic.

In 2024, there was a 445% increase in the number of cases compared to the same period in 2023.

FOB staff taught dengue prevention in our partner communities &

60% reported a decrease in dengue or maintained zero cases.

Nurse Minerva got her hands dirty while teaching how to divert standing water in the community so it won't attract mosquitos.

Nurse Minerva taught all ages how to treat the pila (the community's water collection basin) with mosquito prevention tablets.

The peak time for dengue aligned with a peak time for agriculture. FOB staff went door to door so that busy community members could still learn how to prevent dengue.
